Why LAZYCOW ?

Manual setup, every single session

STAKEHOLDERS

New User · Guest User · Registered User · Community Contributor

Everyday productivity workflow: developers, students, and office workers repeating the same manual setup.

Access & Dashboard

- FR_1
- FR_2
- FR_3
- FR_4
- FR_5
- FR_6

IDENTIFICATION

Roles elicited from access scenarios: New User, Guest, Registered — US_1, US_3, US_4, US_5.

VALIDATION

AC: 3 entry options shown; guest skips auth; sidebar loads correct page on click; empty state message verified.

JUSTIFICATION

Zero-friction entry is the first impression — must work before anything else in the app matters.

Shortcut Builder

Execution & Tray Launch

IDENTIFICATION

US_12, US_13 — one trigger opens everything; windows shouldn't need manual arranging.

VALIDATION

AC: all items launch within a few seconds; failed item shows reason, others continue; tray list launches directly.

JUSTIFICATION

Reliability requirement — one broken path (missing file) must never block the rest of the session.

Community & Cloud Sync

FR_8-12

FR_27

DONE	IN PROGRESS	TO DO
Cloud sync workflow finalized User stories approved Validation rules specified	- FR_8 Browse shared shortcuts - Sort by popularity - Sort by newest - Sort by downloads - Backend API planning	- FR_9 Search - FR_10 Import - FR_11 Flag invalid - FR_12 Recommend - FR_27 Cloud sync

IDENTIFICATION US_7, US_14 — browse/import shared shortcuts; sync across devices for registered users.	VALIDATION AC: sorted by user count; case-insensitive search; recommend increments count; sync shows success/fail status.	JUSTIFICATION Growth & retention layer — specified with full acceptance criteria now so build can start next phase, no ambiguity.
--	---	---

Account & App Settings

Username & Password

Edit credentials, validated and saved.

Gmail Link / Unlink

Toggle Gmail auth anytime, not just at signup.

Delete Account

Removes cloud data after confirmation prompt.

Cloud Save Toggle

Applies immediately when changed.

Startup / Tray / Reset

Run at startup, minimize to tray, factory reset.

FR_13-16

FR_17-19

IDENTIFICATION

US_8, US_9 — registered users need control over identity, cloud, and app behavior.

VALIDATION

AC: edits validate before save; startup toggle registers Windows entry; reset restores defaults after confirmation.

JUSTIFICATION

User trust & control — account and data ownership must be transparent, not buried or irreversible by accident.

From User Stories to Conflict-Free Specifications

1 Duplicate Hotkeys

USER STORY CONFLICT

US_11 allows any hotkey — user could assign the same combo to two shortcuts.

HOW WE RESOLVED IT

FR_22 AC: duplicate assignment shows warning, save blocked, conflict names the existing shortcut.

IMPLEMENTATION

Real-time validation in Builder — red error the moment a duplicate is detected.

2 System-Critical Shortcuts

USER STORY CONFLICT

User wants Win+L or Ctrl+Alt+Del as a trigger — but these lock the PC.

HOW WE RESOLVED IT

Blocklist of 17 system shortcuts + OSCriticalWarningModal on deletion attempts.

IMPLEMENTATION

Yellow warning modal, red exclamation icon, "Delete Anyway" confirmation required.

3 Duplicate Shortcut Names

USER STORY CONFLICT

Two shortcuts could silently share a name — user can't tell them apart.

HOW WE RESOLVED IT

FR_6 AC: case-insensitive duplicate name check, inline error message.

IMPLEMENTATION

Live validation as user types — error names the shortcut that already owns it.

Why This SRS Is Justified?

1 Traceability

Every functional requirement maps back to a user story. Nothing built just because it seemed interesting — every feature answers a specific user need.

2 Testability

All acceptance criteria are measurable. “Duplicate hotkey shows warning” is a yes/no test - any developer can verify completion objectively.

3 Conflict Resolution

Duplicate hotkeys, system-critical shortcuts, duplicate names - resolved during analysis, not discovered after deployment.

4 Future-Ready

Community, cloud, and account features are pre-specified with full acceptance criteria - ready for development, no ambiguity.

The SRS is our contract with the future — what to build, why it matters, and how to know when it's done.
